# VIVEK REDDY YASA

Tampa, FL | 813-732-0572 | vivekreddyyasa@usf.edu

## SUMMARY

Master of Science in Data Intelligence candidate at the University of South Florida, graduating December 2027, with 1.5 years of enterprise applications experience across Oracle Fusion Cloud supply chain planning, system integrations, and artificial intelligence agent deployment. Experienced in working between business users and technical teams to turn planning requirements into working solutions. Open to internship opportunities across enterprise applications, supply chain technology, data, and applied artificial intelligence, for Summer 2027 and earlier.

## EDUCATION

**University of South Florida, Tampa, FL** Jan 2026 - Dec 2027 (Expected)
*Master of Science in Data Intelligence, Industrial and Management Systems Engineering* *GPA: 4.0 / 4.0*

**Woxsen University, Hyderabad, India** Aug 2021 - Apr 2025
*Bachelor of Technology in Computer Science and Engineering* *Conferred Oct 2025*

## TECHNICAL SKILLS

**Enterprise Applications:** Oracle Fusion Cloud Supply Chain Planning, Oracle Integration Cloud, File-Based Data Import, Oracle Business Intelligence Publisher, SAP and Oracle E-Business Suite (EBS) R12 as source systems

**Artificial Intelligence and Programming:** Python, Oracle AI Agent Studio, Large Language Models including Llama and Cohere, Transformers (BERT), TensorFlow, PyTorch

## PROFESSIONAL EXPERIENCE

**Associate Enterprise Applications Analyst** Jul 2024 - Dec 2025
*BisolQ, Hyderabad, India*

- Worked across the Demand Management, Sales and Operations Planning, and Supply Planning teams during a cloud migration from legacy Enterprise Resource Planning systems to Oracle Fusion Cloud, establishing what planning data each team needed and how it had to flow into the new system
- Designed the planning data structure for Sales and Operations Planning and Supply Planning by taking requirements from business users and defining custom measures and user-defined hierarchies, giving planners the data organization they needed for accurate supply decisions and management reporting
- Owned the functional design of the Oracle Integration Cloud integrations that connected four source systems, including SAP and Oracle E-Business Suite (EBS) R12, to Oracle Fusion, writing the data mappings, validation rules, and test scenarios that cleared each integration for go-live
- Resolved recurring File-Based Data Import failures by tracing them to duplicate source files and missing master data, then defined and tested Oracle Business Intelligence Publisher reports that flagged failed load rows by entity, giving the team a weekly check that kept inventory and demand data accurate in the plan
- Improved demand forecast accuracy by 8 percent through hyperparameter tuning across the Oracle Demand Management forecasting profiles
- Deployed artificial intelligence agents in the Oracle Fusion planning modules using Oracle AI Agent Studio, building the prompts, starter questions, and security roles that gave planners conversational access to planning data
- Configured the Planning Advisor agent team in Supply Planning with intent classification, supervisor routing, and worker agents, so planners could get supply, demand, and order answers from one question instead of several planning screens
- Set up the Plan Exceptions and Plan Notes assistants to summarize open exceptions and item-level notes on request, cutting the time planners spent finding the issues that needed action
- Built the agent knowledge sources and compared large language models, including Llama and Cohere, on answer accuracy, enabling more than 25 planners to self-serve instead of raising support requests
- Supported month-end and weekend planning cycles by monitoring plan runs and data loads, resolving issues as they came up so planners closed each cycle on time

**Data Science Intern** Mar 2024 - Jul 2024
*The Alpha AI, Hyderabad, India*

- Built the first stage of an automated matching pipeline for a client's talent marketplace, replacing the manual step where every incoming request and expert profile was tagged with the skills and tools involved before experts could be shortlisted
- Owned the model end to end, from data preprocessing through training multiple transformer models, hyperparameter tuning, and learning rate scheduling to select the best performer
- Reached 91.7 percent accuracy on unseen data and cut total turnaround time by 25 percent, delivering the model as a service that returned each tag with a confidence score for reviewers to confirm instead of tagging from scratch

**OPS Student Assistant, EGN 4450 Introduction to Linear Systems** Aug 2026 - Present
*University of South Florida, Department of Industrial and Management Systems Engineering*

- Grade assignments for an undergraduate engineering course, explain grading decisions and course concepts to students over Microsoft Teams, email, and Canvas, and coordinate with the professor, teaching assistant, and fellow grader to keep marking consistent and on schedule

## PROJECTS

**Liver Fibrosis Classification** Python, TensorFlow, Transfer Learning

- Prepared and labeled a dataset of 6,323 ultrasound images across three-stage METAVIR grades, applying consistent labeling conventions and removing unusable scans so the training set was clean and defensible
- Trained and evaluated convolutional neural network models using transfer learning, recording the configuration and result of each experiment so any run could be reproduced and compared
- Reached 91.4 percent accuracy and a 94.6 percent F1-score, beating a ResNet benchmark by 3.5 percent accuracy and 6.6 percent F1-score

**Hybrid Tomato Quality Assessment** Python, Transfer Learning, Ensemble Methods

- Trained and evaluated multiple deep learning models on a tomato image dataset, comparing architectures instead of relying on a single network
- Passed the features those models learned to classical classifiers, building a support vector machine and random forest ensemble for the final quality classification
- Improved classification accuracy by 6 percent over published benchmarks, comparing results across model and classifier combinations to pick the final pipeline

**Supply Chain Planning Intelligence Platform** Python, FastAPI, Postgres, Vector Search

- Built and deployed a planning assistant that answers supply and demand questions in plain language over planning documentation and master data
- Set up a Postgres database with vector search and a FastAPI service layer, taking the project from an empty repository to a running deployment
- Added an agent layer that routes each question to the right retrieval step and returns an answer grounded in the data it retrieved
